

A

Figure S6

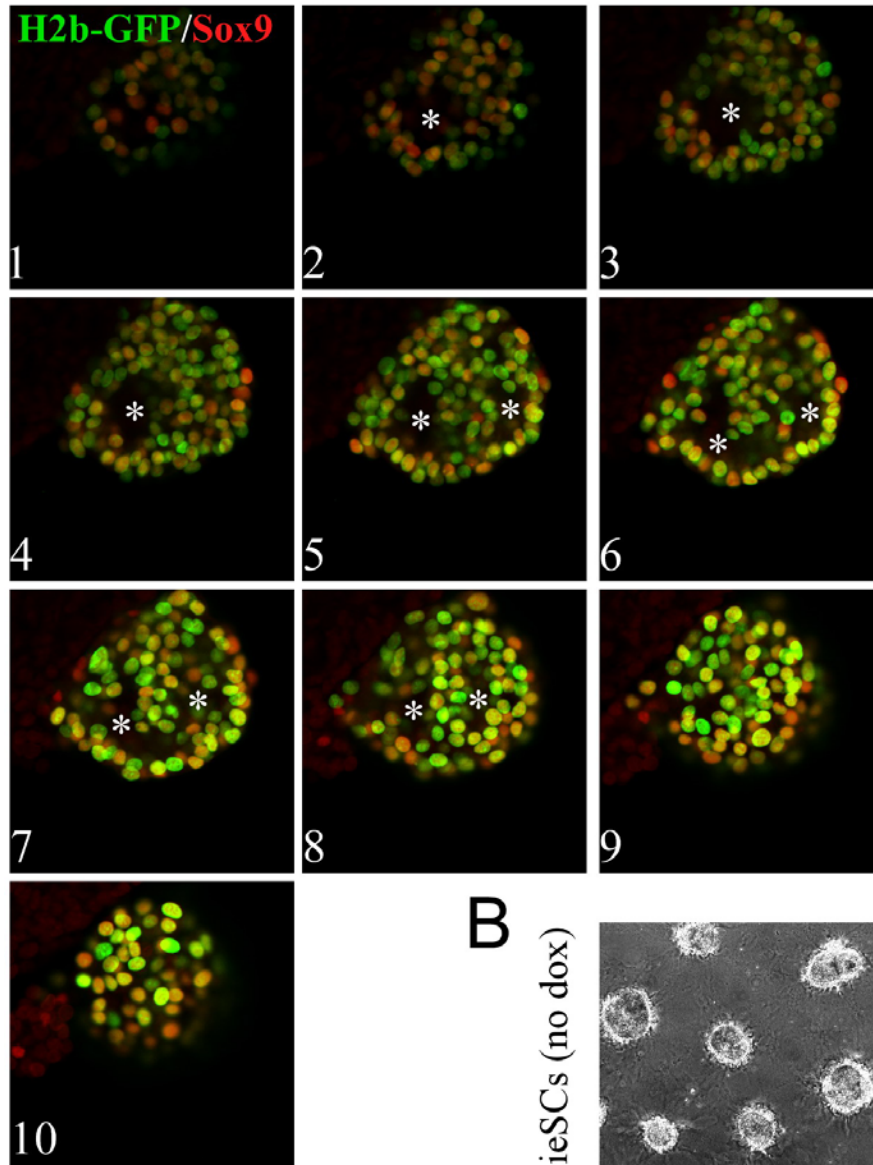

Figure S6. *ieSCs* can form hollow spheres independently of dox. (A) H2b-GFP-*ieSCs* (green) formed cord-like structure when cultured on matrigel in 10% FBS medium. The structure was immunostained for Sox9 (red) and visualized with confocal microscope. White asterisks mark hollow compartments. Section numbers indicate sequential z-axis confocal scan through one sphere **(B)** Bright field image of *ieSCs* cultured on matrigel in 10% FBS medium for a period of 30 days without dox. Error bars represent standard deviation of technical duplicates of the same experiment. Related to main Figure 5.
