

Supplementary Figure 2 Positions of informative sequence family variants (SFVs) along chimpanzee ampliconic sequence. Each row represents one SFV. Numbers at left refer to PCR assay. The letters in each row represent sequence content of the SFVs within amplicon copies. There are multiple SFVs for each PCR assay in almost all cases. SFVs from P6, P7, and P8, which are embedded in X-degenerate sequence, are not shown. Sequences of PCR primers and amplification products are given in supplementary file 1.
