

Supplementary Figure 11 Triangular dot plot of DNA sequence identities within the ampliconic portions of the chimpanzee MSY as in Figure 3, but here with detailed view of amplicons. Each dot represents 100% identity within a 200-bp window. Direct repeats appear as horizontal lines, inverted repeats as vertical lines, and palindromes as vertical lines that nearly intersect the baseline. Immediately below the plot is a schematic depiction of the organization of amplicons, with colors distinguishing amplicon families and arrows indicating amplicon polarity. Inset in upper right corner highlights arrangement of the tandem palindrome array.
