**Fig. S1.** Heat map showing significant changes in gene expression between male and female germ cells at each developmental time point (Top three rows, male divided by female), between time points in female germ cells (Middle three rows, later divided by earlier time points), or between time points in male germ cells (Bottom three rows, later divided by earlier time points). Genes were included if they were differentially regulated in at least one comparison at \( P < 0.05 \) after correction for multiple hypothesis testing (two-sided analysis of variance using DESeq).
