

**Supplemental Figure S15: Correlation of Z-linked gene-specific dosage compensation with human-chicken-conserved site excess.** Distributions of chicken male/female expression ratios, normalized to those of human and anolis (y-axis) for expressed Z-linked genes with no W homolog with (left) or without (right) an excess of human-chicken-conserved miRNA sites. \*\*  $p < 0.01$ , \*\*\*  $p < 0.0001$ , Wilcoxon rank-sum test.
